microtubule—associated protein homolog - fruit fly (Drosophila melanogaster)
NyAlternate names: hypothetical protein EG:49E4.1
C;Species: Drosophila melanogaster
C;Date: 13-Aug-1999 #sequence_revision 13-Aug-1999 #text_change 17-Nov-2000
C;Accession: T13564
R;Spanos, L.; Pappajannakis, G.; Siden-Kiamos, I.; Louis, C.
submitted to the EMBL Data Library, April 1999
A;Description: Sequencing the distal X chromosome of Drosophila melanogaster.
A;Reference number: Z17689
A;Accession: T13564
A;Accession: T13564
A;Accession: T13564
A;Accession: L5327 cspA>
A;Molecule type: DNA
A;References: EMBL:AL031128; PIDN:CAA20006.1
C;Genetics:

SwissProt 42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Expressed prior to callularization in stage 3 embryos, and in blastoderm cells, including pole cells. Expressed throughout the rest of embryogenesis. Later, it is Expressed at higher level in epidermal cells and CNS. DEVELOPMENTAL STAGE: Isoform 3 is expressed both maternally and
                                                                                                                                                                                                   Development 130:3125-3135(2003).

-!- FUNCTION: Probable corepressor protein, which regulates different key pathways such as the EGF receptor and Wg pathways. Involved in neuronal cell fate, survival and axon guidance, cell cycle regulation and repression of head identity in the embryonic trunk. May act with the Hox gene Deformed and the EGF receptor signaling pathway. Positive regulator of the Wg pathway in larval tissues but not in embryonic tissues. May act as a transcriptional corepressor protein, which repress transcription via the recruitment of large complexes containing histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CAUTION: It is uncertain whether Met-1 or Met-7 is the initiator.
                 "split ends, a new component of the Drosophila EGF receptor pathway, regulates development of midline glial cells.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Comment=2 isoforms, 1 (shown here) and 2, are produced by use

Ben-Yosef T., Franconano C.A.;
Characterization of the human talin (TLM) gene: genomic structure,
chromosomal localization, and expression pattern.";
Genomics 62.1316-319(1999).
-!-FINCTION: Probably involved in connections of major cytoskeletal
structures to the plasma membrane. High molecular weight
cytoskeletal protein concentrated at regions of cell-substratum
contact and, in lymphocytes, at cell-cell contacts (By Homo sapiens (Human). Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Butheria, Primates, Catarrhini, Hominidae, Homo. Mao L., Fan Y.H.; "Complete cDNA sequence of human talin."; Submitted (JUL-1998) to the EMBL/GenBank/DDBJ databases. TIN1 HUMAN STANDARD; PRT; 2541 AA. 091490; 09NZQ2; 09UHHB; 16-OCT-2001 (Rel. 40, created) 16-OCT-2001 (Rel. 40, last sequence update) 15-MAR-2004 (Rel. 43, Last annotation update)

| RT "Generation and initial analysis of more than 15,000 full-length RT human and mouse cDNA sequences."; RL Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002). CC -!- FUNCTION: Probably involved in connections of major cytoskeletal CC structures to the plasma membrane. High molecular weight CC contact and, in lymphocytes, at cell-cell contacts. CC -!- SUBUNIT: Binds with high affinity to vinculin and with low affinity to integrins. CC -!- PTM: Phosphorylated. CC -!- SIMILARITY: Contains 1 FERM domain. CC -!- SIMILARITY: Contains 1 I/IMMEQ domain. | This SWISS-PROT entry is copyright. TISSUE SPECIFICITY: Expressed in most adult tissues, including a variety of hematoipoietic cells, with the exception of the liver.

NESCELLANGUS: This gene mapped to a chromosomal region involved in duplications and translocations associated with cancer.

SIMILARITY: Belongs to the transcription factor trithorax family.

SIMILARITY: Contains 5 PHD-type zinc fingers.

SIMILARITY: Contains 1 post-SET domain.

SIMILARITY: Contains 1 SET domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complex that contains a subset of trithorax group proteins.";
Mol. Cell. Biol. 23:140-149(2003)
-!- FUNCTION: May be involved in transcriptional regulation.
-!- FUNCTION: May be involved in transcriptional regulation.
-!- SUBUNIT: Belongs to the ASC-2/NCOA6 complex (ASCOM), which contains ASC-2/NCOA6, the retinoblastoma-binding protein RBD-3/RBPPs, alpha- and beta-tubulins, the trithorax group proteins MIL2 and MIL3, and ASH2/ASCL2.
-!- SUBCELIULAR LOCATION: Nuclear (Probable).
SEQUENCE FROM N.A. (ISOFORMS 1; 2 AND 3).

           Note=No experimental confirmation available, TISQUE SPECIFICITY: Highly expressed in testis. Transcripts can be found in spermatids during spermatogenesis. No expression in Leydig cells, spermatogonia or spermatocytes. Detected at low levels in all tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Coiled coil; Phosphorylation; Alternative splicing.

132 217 GOLGI-TARGETING DOMAIN (BY SIMILARITY)
                                                                                                       -!- DOMAIN: Extended rod-like protein with coiled-coil domains.
-!- PTM: Cleaved by caspases in apoptotic cells (By similarity)
-!- PTM: Phosphorylated (By similarity).
-!- SIMILARITY: Belongs to the golgin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Spermatogenesis; Developmental protein; Golgi stack;

-!- FUNCTION: Cytoskeletal linker protein. Anchors keratin-containing
-!- FUNCTION: Cytoskeletal linker protein. Anchors keratin-containing
intermediate filaments to the inner plaque of hemidesmosomes. The
proteins may self-aggregate to form filaments or a two-dimensional
mesh (By similarity).
-!- SUBGNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

             -!- DISEASE: BPAG1 is an autoantigen of bullous pemphigoid
[MIM:600088], an autoimmune subepithelial skin blistering disease.
-!- SIMILARITY: Belongs to the plakin or cytolinker family.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
-!- SIMILARITY: Contains 1 SH3 domain.
-!- SIMILARITY: Contains 29 spectrin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                       GO: GO:0005737; C:cytoplasm; ISS.

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Probably plays a role in the formation and regulation of the tight junction (TU) paracellular permeability barrier (By similarity).
-!- SUBNUT: Homodimer. Interacts with TJP1/ZO-1 (By similarity).
-!- DOMAIN: Deletion of the ZO-1 interaction mocif (ZIM) decreases but does not abolish colocalization with ZO-1 (By similarity).
